DETAILED ACTION

Claims 19-36 are pending in this application.

Election/Restrictions

Restriction is required under 35 U.S.C. 121 and 372.

This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1.

In accordance with 37 CFR 1.499, applicant is required, in reply to this action, to elect a single invention to which the claims must be restricted.

Group I, claim(s) 19-31, drawn to a method for detecting protease activity in a sample solution.

Group II, claim(s) 32, drawn to a protease assay kit comprising a protease substrate labeled with and electrochemically active marker.

Group III, claim(s) 33, drawn to an apparatus for detecting protease activity in a sample solution.

Group IV, claim(s) 34-36, drawn to a compound comprising a metallocenyl group.

The inventions listed as Groups I-IV do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: The technical feature of Group I, a method for detecting protease activity in a sample solution comprising the method steps of a) contacting the sample solution with a protease substrate labeled with an electrochemically active marker, b) providing conditions under which any protease present in the sample solution may degrade the protease substrate, and c) electrochemically determining information relating to the electrochemically active marker, thereby detecting the protease activity in the sample does not make a contribution over the prior art, and is therefore not deemed to be a "special" technical feature.

Art Unit: 1657

Ludin *et al.* (US 6,495,336 B1) teaches the use of oligopeptide derivatives for the electrochemical measurement of protease activity in a sample solution by contacting a whole blood sample comprising thrombin with an oligopeptide derivative substrate, under conditions wherein the protease is able to cleave off the electroactive amine and determining the activity of the protease by measuring an oxidation or reduction current relating to a change in concentration of the electroactive amine (Columns 15 and 16, Claims 11-13 and 16-18).

Applicant is advised that the reply to this requirement to be complete must include (i) an election of a species or invention to be examined even though the requirement be traversed (37 CFR 1.143) and (ii) identification of the claims encompassing the elected invention.

The election of an invention or species may be made with or without traverse. To reserve a right to petition, the election must be made with traverse. If the reply does not distinctly and specifically point out supposed errors in the restriction requirement, the election shall be treated as an election without traverse.

Should applicant traverse on the ground that the inventions or species are not patentably distinct, applicant should submit evidence or identify such evidence now of record showing the inventions or species to be obvious variants or clearly admit on the record that this is the case. In either instance, if the examiner finds one of the inventions unpatentable over the prior art, the evidence or admission may be used in a rejection under 35 U.S.C.103(a) of the other invention.

Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).
